

C# Take Home Project #8 – SQL Stored Procedure Results Display

Instructions: Write a C# application that calls a SQL Server stored procedure that selects data from a database and displays the results in a control on a form. Make the connection string and stored procedure configurable in the application so the application can be run against any stored procedure of our choosing and so you don't need to send us your database.

Time Limit: Estimated 2-4 hrs (Max 4 hours)

Distribution: Supply the source code and the compiled application. Our email server rejects code in attachments so please share another way.
